AMENDMENTS TO THE CLAIMS

Please add or amend the claims to read as follows, and cancel without prejudice or

disclaimer to resubmission in a divisional or continuation application claims indicated as

cancelled:

1. (Currently Amended) A method of detecting read errors in a set of NVM cells, said

method comprising:

during or prior to programming of the set of NVM cells, counting the number

of cells to be programmed to, up to and/or above one or more logical states of a set of

logical states associated with the NVM cells; and

comparing the number of cells read at a given state against a value

corresponding to a number of cells which should be at the given state based on the

counting performed during or prior to programming.

2. (Currently Amended) The method according to claim 1, wherein counting comprises

counting the number of NVM cells to be programmed at or above each logical state

associated with the set of cells.

3. (Original) The method according to claim 1, wherein comparing comprises

comparing the number of cells read at a given state to the number of cells of the set

which were programmed at or above the given state and the number of cells of the set

which were programmed at or above a logical state adjacent to and higher than the

given state.

4. (Original) The method according to claim 3, further comprising determining the number of cells which should be at the given state by subtracting the number of cells of the set which were programmed at or above the given state by the number of cells

of the set which were programmed at or above a higher adjacent state to the given

state.

5. (Currently Amended) A method of adjusting one or more read verify reference levels

of a set of cells comprising:

during or prior to programming of the set of cells, counting the number of

cells to be programmed to, up to and/or above one or more logical states of a set of

logical states associated with the set of NVM cells;

comparing the number of cells read at a given state against a value

corresponding to a number of cells which should be at the given state based on the

counting performed during or prior to programming; and

either raising or lowering a read verify level associate with the given state, or

associated with an adjacent state, based on the comparison.

6. (Original) The method according to claim 5, wherein counting comprises counting the

number of cells to be programmed at or above each logical state associated with the

set of cells, comparing comprises comparing the number of cells read at a given state

to the number of cells of the set which were programmed at or above the given state

and the number of cells of the set which were programmed at or above a logical state

adjacent to and higher than the given state.

7. (Original) The method according to claim 6, wherein if the number of cells read at a

given logical state is lower than the number of cells expected at the given state, either

the read verify level associated with that given state may be lowered or the read

verify level of the adjacent higher state may be raised.

8 (Original) The method according to claim 6, wherein if the number of cells read at a

given logical state is greater than the number of cells expected at the given state,

either the read verify level associated with that given state may be raised or the read

verify level of the adjacent higher state may be lowered.
